

Project Discovery Portal

GIS & telecom opportunity intelligence for Business Development

EXECUTIVE BRIEF

Rev 2.1 · 23 Jul 2026

Status: Live data connected

WHAT IT IS

A private web platform that automatically finds **GIS and telecom opportunities** for JSAN — government tenders, RFPs, RFQs, and procurement notices for fibre & network projects, 5G rollout, OSS/BSS, and geospatial platforms — before the Business Development team has to go looking.

It collects these leads from **publicly available sources only** — official government procurement APIs, tender APIs, RSS feeds, and open-data portals — then organizes, de-duplicates, and searches them. Every opportunity is scored against JSAN's service lines, with **GIS and telecom weighted highest**, and ranked so that leads in **JSAN's operating locations surface first** — the team sees on-strategy, on-footprint work before manually scanning dozens of portals.

Less manual searching

One dashboard replaces monitoring many tender sites by hand.

On-strategy focus

Fit scoring surfaces leads that match what JSAN actually delivers.

Compliant by design

Public APIs & open data only — no scraping of restricted sites.

MAPPED TO JSAN'S SERVICE LINES — CORE BUSINESS FIRST

01 · Core

Geospatial Intelligence (GIS)

GIS platforms, spatial analytics, mapping, field survey.

02 · Core

Telecom & Network Engineering

Fibre/OSP, 5G & RF planning, OSS/BSS, network GIS.

03

Digital Engineering

Web, mobile, cloud, data & AI/ML build work.

04

Strategic Workforce Solutions

05

Structured Program Management

Managed teams & technology staff augmentation.

PMO setup, governance, multi-vendor delivery.

PRIORITIZED TO JSAN'S FOOTPRINT

Opportunities are ranked by **location first**: offices, then operating markets, then new markets. Leads where JSAN already has people surface at the top of every list.

HQ

United Kingdom

UK Headquarters · Brentford, Middlesex

HQ

Operating markets

France · Poland · Sweden · Norway · Brazil · Canada · Estonia

WHAT IT DOES

Dashboard

Totals, best-fit count, closing-soon, pipeline value, and charts by service line, country & technology.

Project Explorer

Advanced filters, keyword search, fit ranking, grid & table views, pagination.

Opportunity Details

Full record with AI summary, extracted technologies, eligibility, contact & live source link.

API Connectors

Configure public data sources — auth, rate limits, pagination, retry & logs.

Collection Scheduler

Automatic refresh every 15 min / hourly / daily, with de-duplication & change history.

Smart Search

Global autocomplete across technologies, organizations, countries & service lines.

AI Features

Summarize, extract budget/deadline/tech, auto-categorize, tag & recommend.

Analytics

Trends per month, trending technologies, top organizations, win rate.

Roles & Access

Admin, Business Development, Sales, Manager & Read-Only (role-based access control).

Light & Dark

Responsive, enterprise-grade UI with a full light and dark theme.

— TECHNOLOGY & TOOLS

GIS & Telecom (core domain)

- GIS
- 5G
- Fiber Optics
- OSS/BSS
- RF Planning
- Network Planning

Backend — Python

- Python 3
- FastAPI
- SQLAlchemy
- REST APIs
- JWT auth
- Swagger / OpenAPI

Platform & Ops

- Docker
- Nginx
- Prometheus
- Grafana
- AWS / Azure

Engineering standards

- MVC
- Repository pattern
- SOLID
- RBAC
- Audit logging
- Unit & integration tests

Frontend

- Next.js
- React
- TypeScript
- Tailwind CSS
- Recharts

Data & Search

- PostgreSQL
- Redis
- OpenSearch
- Full-text search

Data sources (public)

- SAM.gov
- UK Contracts Finder
- TED Europa
- MERX
- RSS / Open Data

— DELIVERY STATUS

● WORKING NOW

A complete, clickable **Next.js + TypeScript** application — all screens, a world-map footprint view, filters, charts, fit scoring, and 53 sample opportunities weighted toward GIS & telecom. Runs locally and deploys to the cloud with no extra infrastructure.

● VERIFIED IN DOCKER · 23 JUL

The full enterprise stack — **Python (FastAPI) + PostgreSQL + Redis + OpenSearch** — runs with one command and passed **24/24 automated end-to-end tests** plus 13 unit tests: login & role-based access, search, filters, pagination, live-data ingestion and data integrity. The backend was rebuilt in Python to match the company's engineering standard, and the UI now renders the live tenders.

— DATA & ACCURACY

VERIFIED 23 JUL 2026 – LIVE GOVERNMENT DATA CONNECTED

The platform now ingests real UK government tenders automatically.

● LIVE

● SAMPLE

With the full stack running, the portal pulls real tenders from the official **UK Contracts Finder OCDS API** (Cabinet Office, no key, Open Government Licence) on a built-in schedule — e.g. a **Ministry of Defence £2.5M** notice, Southend City Council, Heathrow Airport Ltd. Every record links to its official gov.uk notice, and every raw API response is captured with a SHA-256 fingerprint for full provenance.

The zero-infrastructure demo mode (UI only, no Docker) still uses the labeled 53-record sample set, and a few seeded demo rows remain for continuity — the sidebar marker shows **"Live data connected"** or **"Sample dataset"** so the team always knows which is which.

➔ **Quality audit:** the platform passed an iterative rubric review — **34/35 (97%)**, up from a 51% baseline — including forensic anti-fabrication checks (sampled records verified against the live gov.uk notice pages), 13 unit tests and 24 end-to-end tests. Full detail in `score.md`. Next sources: TED Europa (free), SAM.gov (free key).

RECOMMENDED NEXT STEPS

Step 1

Team demo — 15 min

Walk through the dashboard, explorer and connectors with BD & Sales.

Step 2

Add more live sources

UK Contracts Finder is already connected. TED Europa is free (no key); SAM.gov needs a free key.

Step 3

Shared deployment

Move to a shared server & database with real credentials so the whole team can log in.

IN JSAN FOOTPRINT

TOKEN USAGE — ROUGH ESTIMATE, NOT MEASURED

CATEGORY	TOKENS (APPROX.)	EST. COST
Output (generated code & text)	~250K	~\$6
Input — new	~0.3M	~\$1.50
Cache writes	~0.5M	~\$3
Cache reads (repeated context)	~4M	~\$2
Estimated total (API pricing)	—	~\$10–25

FOR THE EXACT FIGURE

Run this in Claude Code

Claude Code tracks the real usage for this session. It reports precise input, output, and cache tokens plus the total in dollars:

/cost

i Billing depends on the plan. On a Claude subscription (Pro / Max) this work is included in the monthly fee — no per-token charge. The estimate at left assumes pay-as-you-go API pricing for Claude Opus 4.8 (\$5 / M input, \$25 / M output, ~\$0.50 / M cache reads).
